Consommation d'électricité du réseau genevois, selon le genre d'utilisation, depuis 1984

Electric consumption in Canton Geneva by economic sector and public usage.

Remarks:

- The districts served by the Services industriels de Genève (SIG) do not correspond exactly to the territory of the Canton;
- CERN electric consumption is not accounted;
- The General Classification of Economic Activities (NOGA) was revised in 2002 and 2008 limiting the comparison of results between years;
- Before 2008, street lighting only. From 2008, street lighting and light signage included.

Circularity Apeldoorn

Material Flows in Apeldoorn

Measuring material flows and circularity is a data heavy exercise. Numerous datasets were collected and visualised throughout the Urban Circular Assessment process. To synthesise these findings, a Sankey diagram illustrates how material flows of the local economy of Apeldoorn are circulating from one lifecycle stage to another. The height of each line is proportional to the weight of the flow. This diagram therefore helps to quickly have an overview of all the materials flows that compose the economy and their respective shares. The flows that are coloured in light blue in the Sankey diagram, are return flows. This means that they flow in the opposite direction of the lifecycle stages and are subjected to reuse, redistribution, or remanufacturing. Their size relative to the others is a good indication for a materials' circularity.

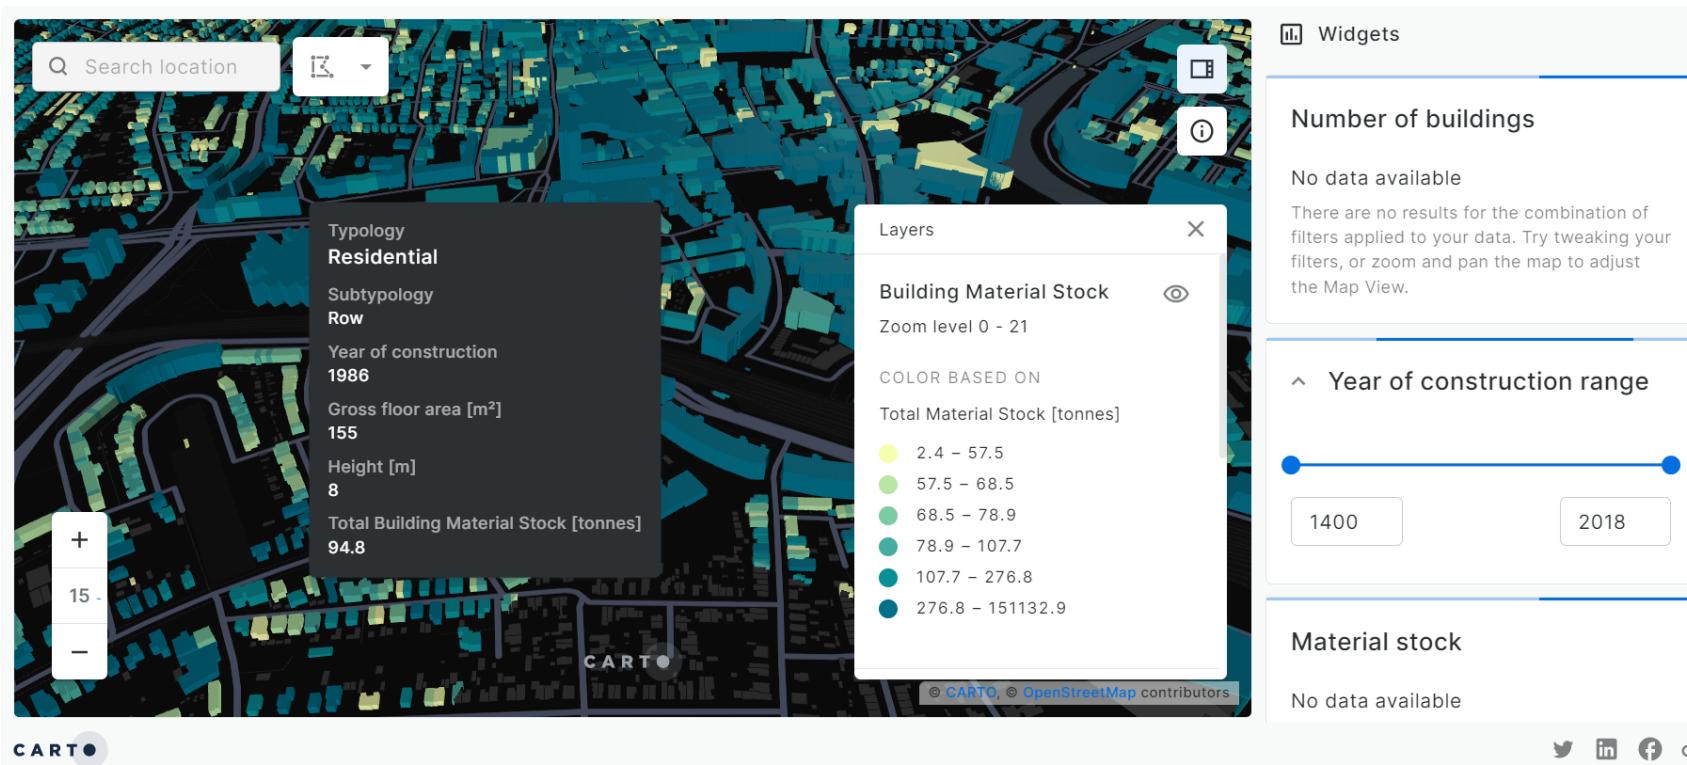

Material Stock Apeldoorn

Material stock in Apeldoorn

Determining and analysing the material stock of a city can, similarly to the material flow accounting, also be a data intensive endeavour. The intensity depends on the scope and the data availability. For the Urban Circularity Assessment, the scope includes all residential and non-residential buildings in the municipality. Unlike for the material flow quantification, the analysis is not done for one or several specific reference years, but considers all buildings that have been constructed and still exist, up until and including 2022 (year of study). The aim is to quantify the materials that every single building contains and represent them spatially on a map. Depending on the data availability around building typologies, age cohorts, building height and material intensities, different, specific quantifications and investigations can be made.

The embedded map allows to explore the building stock of Apeldoorn and interact with the different scales and buildings by zooming in and out, and clicking on the buildings to discover more about typologies and quantity of building materials. The widgets on the right can be used to account for certain information, e.g. the number of buildings in an area, or to filter for specific construction years, which in combination with the average useful life of buildings can be used to calculate the potential urban mine. Furthermore, an analysis can also be performed by using the lasso tool and drawing an area (a block, a neighbourhood or an urban area) to be analysed.

Réutiliser la mine urbaine

An aerial photograph of a dense suburban residential area. The neighborhood consists of numerous single-family homes with tan or beige exteriors and red-tiled roofs. The houses are arranged in a grid pattern, separated by paved streets and small yards. Some larger homes feature swimming pools. The overall layout is highly planned and organized.

Table 2

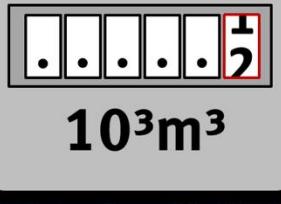

. Inventory of the prerequisites for *Decent Living Standards* (DLS) (Rao and Min, 2018a) alongside activity levels and direct and indirect energy intensities of products, supply chains and infrastructure. Numbers are rounded and presented as ranges where there are variations between countries or sub-activities (e.g. different transport modes). *Approximate* percentage increases for *Higher Demand* (HD) and *Less Advanced Technology* (LAT) scenarios are included where possible, but these cannot always be summarised in this high-level format. Full details can be found in the Supplementary materials.

| DLS dimensions & services | Activity levels | | Energy Intensities | | | |
